### Models of high- $p_T$ parton energy loss

Two different "categories" of models of parton energy loss, depending on the basic underlying process:

*E* also "in vacuum", but controlled by the presence of a medium

"radiative" process (Bremsstrahlung)

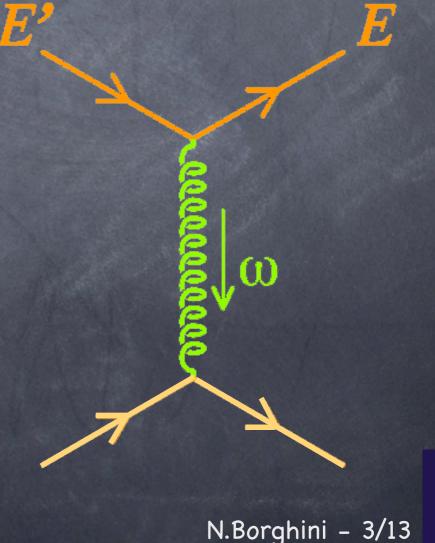

### Models of high- $p_T$ parton energy loss

Two different "categories" of models of parton energy loss, depending on the basic underlying process:

(0)

inelastic "<del>radiative</del>" process (Bremsstrahlung)

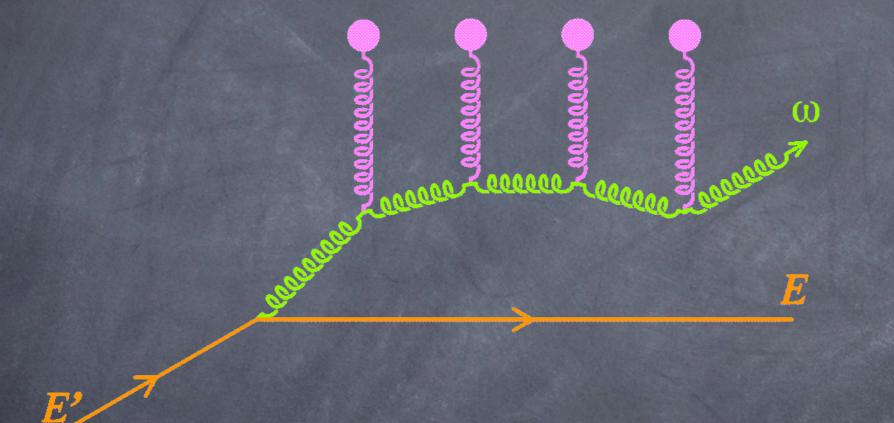

also "in vacuum", but controlled by the presence of a medium <u>collisions!</u> elastic "<del>collisional</del>" process

### Inelastic energy loss Models based on the Landau-Pomeranchuk-Migdal effect [1/4]

The propagating high- $p_T$  parton traverses a thick target.

It radiates soft gluons, which scatter **coherently** on independent color charges in the medium, resulting in a medium-modified gluon energy spectrum.

Multiple soft scattering limit

ALICE Physics Working Group 4 – CERN, July 19, 2006

N.Borghini - 4/13

Inelastic energy loss Models based on the Landau-Pomeranchuk-Migdal effect [2/4] Independent scattering centers:  $\lambda \gg 1/\mu$ mean free path 🔶 screening mass Note the assumption, which actually underlies all models of in-medium partonic energy loss LPM only affects gluons with  $\omega \lesssim \omega_c \equiv rac{1}{2} \hat{q} L^2$ Medium characterized by the transport coefficient  $\hat{q}\equiv \frac{\mu^2}{\lambda}$ Baier, Dokshitzer, Mueller, Peigné, Schiff (BDMPS); Zakharov

Inelastic energy loss Models based on the Landau-Pomeranchuk-Migdal effect [3/4] Gluon coherence length  $\ell_{\rm coh} = \sqrt{rac{2\omega\lambda}{\mu^2}}$  $\Rightarrow$  gluon energy spectrum per unit path length  $\omega \frac{\mathrm{d}I}{\mathrm{d}\omega \mathrm{d}z} \simeq \frac{\alpha_s}{\ell_{\mathrm{coh}}} \simeq \alpha_s \sqrt{\frac{\hat{q}}{\omega}}$ For a path length L:  $\omega \frac{\mathrm{d}I}{\mathrm{d}\omega} \simeq \alpha_s \sqrt{\frac{\hat{q}L^2}{\omega}}$ Average medium-induced energy loss:  $\Delta E = \int \omega^{\omega_c} \frac{\mathrm{d}I}{\mathrm{d}\omega} \,\mathrm{d}\omega \simeq \alpha_s \omega_c \propto \alpha_s \hat{q}L^2$ Mer BDMPS-Z, only two parameters:  $\hat{q} \& L$ 

ALICE Physics Working Group 4 – CERN, July 19, 2006

N.Borghini – 6/13

Inelastic energy loss Models based on the Landau-Pomeranchuk-Migdal effect [4/4] What about the infrared ( $\omega \rightarrow 0$ ) behaviour? BDMPS-Z: coherent regime requires  $N_{\rm coh} > 1 \iff \ell_{\rm coh} > \lambda \iff \omega > E_{\rm LPM} \equiv \lambda \mu^2 = \mathcal{O}$  (1 GeV) AMY (Arnold, Moore, Yaffe; Jeon, Gale, Turbide): interaction of the fast parton with a thermal bath  $\checkmark$  LPM energy loss for  $\lambda \sim 1/g_s^2 T$  ,  $\mu \sim g_s T$   $\Rightarrow$   $\ell_{\rm coh} > \lambda$   $\Leftrightarrow$   $\omega \gtrsim T$  $\checkmark$  and for  $0 < \omega < E_{
m LPM} \simeq 1$  GeV, Bethe-Heitler regime Energy loss per unit length proportional to the incoming energy In addition, they allow possible gains in the parton energy Mer AMY approach, three parameters: T , L &  $\alpha_s$ 

ALICE Physics Working Group 4 – CERN, July 19, 2006

N.Borghini - 7/13

Inelastic energy loss Models based on an opacity expansion [1/2]

The high- $p_T$  parton interacts with a thin target:

the energy loss results from an incoherent superposition of very few  $\chi \equiv L/\lambda$  single hard scattering processes along the path length L. The "opacity" (= number of collisions)

 $\Rightarrow$  gluon energy spectrum per unit path length

$$\omega \frac{\mathrm{d}I}{\mathrm{d}\omega \,\mathrm{d}z} \simeq \left(\frac{L}{\lambda}\right) \frac{\alpha_s}{\ell_{\mathrm{coh}}} \simeq \left(\frac{L}{\lambda}\right) \alpha_s \frac{\mu^2}{\omega} \qquad \neq lpha_s \sqrt{\frac{\hat{q}}{\omega}} \text{ within LPM}$$

leads to an average energy loss  $\Delta E \propto L^2$  (for a static medium)

Gyulassy, Lévai, Vitev (GLV); Wiedemann

three parameters:  $\left(\frac{L}{\lambda}\right)$ ,  $\mu \& L$ 

→ ⇔ the (linear) density of scattering centers

#### Inelastic energy loss Models based on an opacity expansion [2/2]

The Within GLV, radiated gluons restricted to  $\omega > \mu = O(500 \text{ MeV})$ , "common value" of the screening mass and the plasmon excitation

So Energy loss actually dominated by energetic gluons  $\omega \gtrsim \bar{\omega}_c \equiv \frac{1}{2}\mu^2 L$ (# LPM, where soft gluons with  $\omega < \omega_c$  mainly contribute)

Only very few (≈3) gluons are radiated by the fast parton

ALICE Physics Working Group 4 - CERN, July 19, 2006

N.Borghini – 8/13

#### Inelastic energy loss Approach based on a twist expansion

In QCD, a cross-section can actually be expanded in powers of  $\frac{1}{2}$  where q is the exchanged (hard) momentum:

"twist expansion"

In vacuum, higher-twist terms are power suppressed (!). But in a medium, these terms may become enhanced:  $A^{1/3} / q^2$ 

 $\Rightarrow$  allow systematic computation of <u>energy loss</u>

formulated in terms of "medium-modified fragmentation functions" (which can be evolved with DGLAP...)

Guo, Wang & Wang

Parameters (?):  $\mu$ , T

#### Inelastic energy loss A model based on modified parton splitting functions

Effect of the medium modeled by a (phenomenological) modification of the Altarelli-Parisi parton splitting functions, considering e.g.

$$P_{qq}(z) = C_F \left( \frac{2(1 + f_{\text{med}})}{1 - z} - (1 + z) \right)$$

where  $f_{\text{med}} = 0$  in the absence of a medium ( $f_{\text{med}}$  only parameter)  $\Rightarrow$  modification of the "hump-backed plateau" of longitudinal particle distributions within a jet computed using MLLA NB, Wiedemann

Modified Leading Logarithmic Approximation (of QCD)

#### Inelastic energy loss A model based on modified parton splitting functions

Effect of the medium modeled by a (phenomenological) modification of the Altarelli-Parisi parton splitting functions, considering e.g.

$$P_{qq}(z) = C_F \left( \frac{2(1+f_{\text{med}})}{1-z} - (1+z) \right)$$

where  $f_{\text{med}} = 0$  in the absence of a medium ( $f_{\text{med}}$  only parameter)

 $\Rightarrow$  modification of the "hump-backed plateau" of longitudinal particle distributions within a jet computed using MLLA

 $\ln\left(\frac{1}{x}\right)$ 

#### Inelastic energy loss A few model-independent remarks [1/2]

actually also valid for models of elastic energy loss

All partons do not lose the same amount of energy, even when they traverse the same in-medium path length L
 ⇒ nuclear modification factor R<sub>AA</sub> mostly reflects the few partons which have lost little energy
 INF use of "quenching weights" (= probability to lose a given energy)

The medium traversed by the parton is not static, but in expansion! model-builders introduce dynamics (most often, à la Bjorken), which may lead to a redefinition  $(\hat{q} \rightarrow \hat{q}_{\text{eff}})$  of the parameters, to the introduction of new ones  $(\tau_0, T_0)$ , or to a change in scaling properties ( $\Delta E_{\text{GLV}} \propto L$  instead of  $L^2$ )

#### Inelastic energy loss A few model-independent remarks [2/2]

A model of partonic energy loss has to be supplemented by several other elements to allow comparison with the data:

- parton distribution functions inside the nuclei (shadowing, Cronin effect...)
- production cross-sections

⇒ seemingly similar conclusions of different models may actually differ

- Turbide et al. (AMY approach), PRC 72 (2005) 014906: reproduce  $R_{AA}$  for pions assuming  $T_i = 370$  MeV,  $\tau_i = 0.26$  fm/c,  $\frac{\mathrm{d}N}{\mathrm{d}u} = 1260$  &  $\alpha_s = 0.3$ .

No need for initial state effects as shadowing & the Cronin effect - GLV, PRL 89 (2002) 252301:  $\frac{dN^g}{dy} = 1100$ 

invoke competition between shadowing, Cronin effect and partonic energy loss to obtain a flat  $R_{AA}$ .

### Elastic energy loss

The elder (Bjorken, 1984), yet still in its infancy...

Bjorken (1984), Thoma & Gyulassy (1991), Braaten & Thoma (1991), Wang, Gyulassy & Plumer (1995), Mustafa et al. (1998), Lin, Vogt & Wang (1998):  $dE_{\rm el.}/dz \approx 0.3 - 0.5$  GeV/fm: negligible!

Then, all of a sudden... Mustafa & Thoma (2003), Dutt-Majumder et al. (2004), Zapp, Ingelmann, Rathsman & Stachel (2005), Wicks, Horowitz, Djordjevic & Gyulassy (2006), Peshier (2006): it is sizable! (either for heavy quarks only, for c only, for light quarks as well...)

Yet, at the same time...

Peigné, Gossiaux, Gousset (2005): yes, elastic energy loss is negligible, because the parton is formed inside the medium, not at infinity.

Conclusion... all this is very premature (and too "politics-driven"?)

#### Inelastic energy loss a teaser slide...

Could one compute the transport coefficient  $\hat{q}$  ab initio, even in the non-perturbative case?

Idea: use Maldacena's conjecture of a correspondence between QCD and its dual weakly coupled theory of gravity living in a 5-dimensional anti-de Sitter space-time.

More practically, since the dual of QCD is unknown, replace it by some supersymmetric Yang-Mills theory ("SYM N=4").

$$\hat{q}_{\text{SYM}} = \frac{\pi^2 \sqrt{2} \Gamma(\frac{3}{4})}{\Gamma(\frac{5}{4})} \sqrt{\alpha_{\text{SYM}} N_c} T^3$$

Liu, Rajagopal, Wiedemann

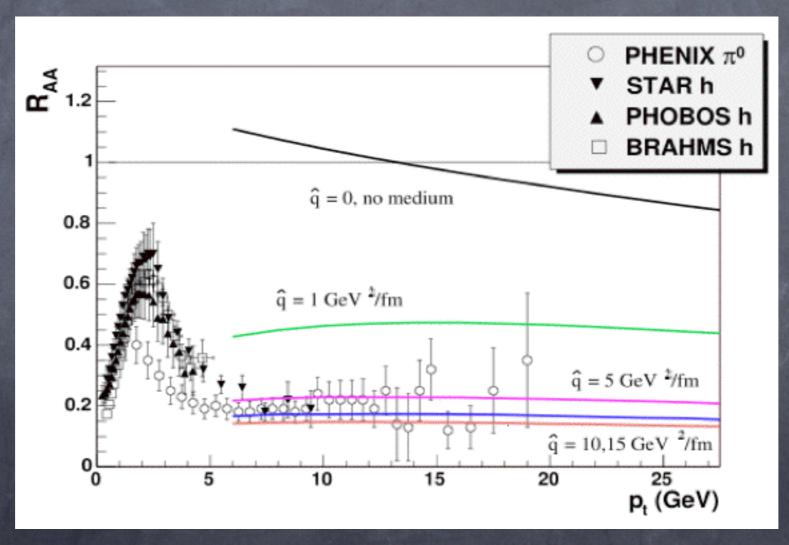

N.Borghini - 13/13

 $\hat{q}_{\text{SYM}} \propto \sqrt{N_c} \neq \text{number of degrees of freedom}$  is proportional to  $N_c^2$  $\leftrightarrow$  entropy density

But... the result is not "universal" (may not hold for QCD)

Inelastic energy loss Additional model-dependent remarks [1/2] Drawing conclusions from fits to the data may not be easy! " $R_{AA}$  is fragile" (Eskola, Honkanen, Salgado, Wiedemann)

Data cannot allow to distinguish between  $\hat{q} =$  5 or 15 GeV<sup>2</sup>/fm

ALICE Physics Working Group 4 – CERN, July 19, 2006

N.Borghini - 14/13

Inelastic energy loss Additional model-dependent remarks [2/2] Let me be even more pessimistic / skeptical... Sekola, Honkanen, Salgado, Wiedemann, NPA 747 (2005) 511:  $\hat{q} = 5 - 15$  GeV<sup>2</sup>/fm, with  $\langle L \rangle \simeq 2$  fm which leads to strong (& questionable?) conclusions Arleo, hep-ph/0601075:  $\hat{q} = 0.3 - 0.4$  GeV<sup>2</sup>/fm, with  $\langle L \rangle \simeq 5$  fm ...but François 1. fixed the latter value a priori & 2. assumed that all partons lose energy Baier & Schiff, hep-ph/0605183:  $\hat{q} = 1 - 3$  GeV<sup>2</sup>/fm, with  $\langle L \rangle \simeq 3$  fm restricting the region of validity of the LPM effect

ALICE Physics Working Group 4 - CERN, July 19, 2006

N.Borghini - 15/13
