

Tutorial sheet 1

The exercise marked with a star is probably better suited as homework.

Discussion topic: Which idealizations underlie the description of a macroscopic many-body system as a continuous medium? How is local thermodynamic equilibrium defined?

*1. Gradient, divergence and curl of products

Show the following identities involving the nabla operator $\vec{\nabla}$, where f , f_1 and f_2 denote scalar fields (on \mathbb{R}^3) while \vec{V} , \vec{V}_1 and \vec{V}_2 are vector fields.

$$\vec{\nabla} [f_1(\vec{r}) f_2(\vec{r})] = [\vec{\nabla} f_1(\vec{r})] f_2(\vec{r}) + f_1(\vec{r}) \vec{\nabla} f_2(\vec{r}). \quad (1)$$

$$\vec{\nabla} \cdot [f(\vec{r}) \vec{V}(\vec{r})] = [\vec{\nabla} f(\vec{r})] \cdot \vec{V}(\vec{r}) + f(\vec{r}) \vec{\nabla} \cdot \vec{V}(\vec{r}). \quad (2)$$

$$\vec{\nabla} \times [f(\vec{r}) \vec{V}(\vec{r})] = [\vec{\nabla} f(\vec{r})] \times \vec{V}(\vec{r}) + f(\vec{r}) \vec{\nabla} \times \vec{V}(\vec{r}). \quad (3)$$

$$\vec{\nabla} \cdot [\vec{V}_1(\vec{r}) \times \vec{V}_2(\vec{r})] = \vec{V}_2(\vec{r}) \cdot [\vec{\nabla} \times \vec{V}_1(\vec{r})] - \vec{V}_1(\vec{r}) \cdot [\vec{\nabla} \times \vec{V}_2(\vec{r})]. \quad (4)$$

$$\vec{\nabla} \times [\vec{V}_1(\vec{r}) \times \vec{V}_2(\vec{r})] = [\vec{\nabla} \cdot \vec{V}_2(\vec{r})] \vec{V}_1(\vec{r}) - [\vec{\nabla} \cdot \vec{V}_1(\vec{r})] \vec{V}_2(\vec{r}) + [\vec{V}_2(\vec{r}) \cdot \vec{\nabla}] \vec{V}_1(\vec{r}) - [\vec{V}_1(\vec{r}) \cdot \vec{\nabla}] \vec{V}_2(\vec{r}). \quad (5)$$

$$\vec{\nabla} [\vec{V}_1(\vec{r}) \cdot \vec{V}_2(\vec{r})] = \vec{V}_1(\vec{r}) \times [\vec{\nabla} \times \vec{V}_2(\vec{r})] + \vec{V}_2(\vec{r}) \times [\vec{\nabla} \times \vec{V}_1(\vec{r})] + [\vec{V}_1(\vec{r}) \cdot \vec{\nabla}] \vec{V}_2(\vec{r}) + [\vec{V}_2(\vec{r}) \cdot \vec{\nabla}] \vec{V}_1(\vec{r}). \quad (6)$$

Hint: You may introduce Cartesian coordinates if you wish.

2. Stationary flow: first example

(This exercise introduces a number of concepts that will only be introduced in later lectures; this should pose you no difficulty.)

Consider the stationary flow defined in the region $x^1 > 0$, $x^2 > 0$ by its velocity field

$$\vec{v}(t, \vec{r}) = k(-x^1 \vec{e}_1 + x^2 \vec{e}_2) \quad (7)$$

with k a positive constant, $\{\vec{e}_i\}$ the basis vectors of a Cartesian coordinate system and $\{x^i\}$ the coordinates of the position vector \vec{r} .

i. Vector analysis

a) Compute the divergence $\vec{\nabla} \cdot \vec{v}(t, \vec{r})$ of the velocity field (7). Check that your result is consistent with the existence of a scalar function $\psi(t, \vec{r})$ (the *stream function*) such that

$$\vec{v}(t, \vec{r}) = -\vec{\nabla} \times [\psi(t, \vec{r}) \vec{e}_3] \quad (8)$$

and determine $\psi(t, \vec{r})$ — there is an arbitrary additive constant, which you may set equal to zero. What are the lines of constant $\psi(t, \vec{r})$?

b) Compute now the curl $\vec{\nabla} \times \vec{v}(t, \vec{r})$ and deduce therefrom the existence of a scalar function $\varphi(t, \vec{r})$ (the *velocity potential*) such that

$$\vec{v}(t, \vec{r}) = -\vec{\nabla} \varphi(t, \vec{r}). \quad (9)$$

(*Hint:* remember a theorem you saw in your lectures on classical mechanics and/or electromagnetism.) What are the lines of constant $\varphi(t, \vec{r})$?

ii. Stream lines

Determine the *stream lines* at some arbitrary time t . The latter are by definition lines $\vec{\xi}(\lambda)$ whose tangent is everywhere parallel to the instantaneous velocity field, with λ a parameter along the stream line. That is, they obey the condition

$$\frac{d\vec{\xi}(\lambda)}{d\lambda} = \alpha(\lambda) \vec{v}(t, \vec{\xi}(\lambda))$$

with $\alpha(\lambda)$ a scalar function, or equivalently

$$\frac{d\xi^1(\lambda)}{v^1(t, \vec{\xi}(\lambda))} = \frac{d\xi^2(\lambda)}{v^2(t, \vec{\xi}(\lambda))} = \frac{d\xi^3(\lambda)}{v^3(t, \vec{\xi}(\lambda))},$$

with $d\xi^i(\lambda)$ the coordinates of the (infinitesimal) tangent vector to the stream line.

3. Wave equation

Consider a scalar field $\phi(t, x)$ which obeys the partial differential equation

$$\left(\frac{1}{c^2} \frac{\partial^2}{\partial t^2} - \frac{\partial^2}{\partial x^2} \right) \phi(t, x) = 0 \quad (10)$$

with initial conditions $\phi(0, x) = e^{-x^2}$, $\partial_t \phi(0, x) = 0$. Determine the solution $\phi(t, x)$ for $t > 0$.
