## Tutorial sheet 2

The exercise marked with a star is homework.

## Discussion topics:

- What are the Lagrangian and Eulerian descriptions? How is a fluid defined?
- What are the strain rate tensor, the rotation rate tensor, and the vorticity vector? How do they come about and what do they measure?

# \*4. Stationary flow: second example

Consider the fluid flow whose velocity field  $\vec{v}(t,\vec{r})$  has coordinates (in a given Cartesian system)

$$v^{1}(t, \vec{r}) = kx^{2}, \quad v^{2}(t, \vec{r}) = kx^{1}, \quad v^{3}(t, \vec{r}) = 0,$$
 (1)

where k is a positive real number, while  $x^1, x^2, x^3$  are the coordinates of the position vector  $\vec{r}$ .

- i. Determine the stream lines at an arbitrary instant t.
- ii. Let  $X^1, X^2, X^3$  denote the coordinates of some arbitrary point M and let  $t_0$  be the real number defined by

$$kt_0 = \begin{cases} -\operatorname{Artanh}(X^2/X^1) & \text{if } |X^1| > |X^2| \\ 0 & \text{if } X^1 = \pm X^2 \\ -\operatorname{Artanh}(X^1/X^2) & \text{if } |X^1| < |X^2|. \end{cases}$$

Write down a parameterization  $x^1(t)$ ,  $x^2(t)$ ,  $x^3(t)$ , in terms of a parameter denoted by t, of the coordinates of the stream line  $\vec{x}(t)$  going through M such that  $d\vec{x}(t)/dt$  at any point equals the velocity field at that point, and that either  $x^1(t) = 0$  or  $x^2(t) = 0$  for  $t = t_0$ .

- iii. Viewing  $\vec{x}(t)$  as the trajectory of a point—actually, of a fluid particle—, you already know the velocity of that point at time t (do you?). What is its acceleration  $\vec{a}(t)$ ?
- iv. Coming back to the velocity field (1), compute first its partial derivative  $\partial \vec{\mathbf{v}}(t, \vec{r})/\partial t$ , then the material derivative

$$\frac{\vec{\mathrm{D}}\vec{\mathrm{v}}(t,\vec{r})}{\vec{\mathrm{D}}t} \equiv \frac{\partial \vec{\mathrm{v}}(t,\vec{r})}{\partial t} + \left[\vec{\mathrm{v}}(t,\vec{r})\cdot\vec{\nabla}\right]\vec{\mathrm{v}}(t,\vec{r}).$$

Compare  $\partial \vec{\mathbf{v}}(t,\vec{r})/\partial t$  and  $D\vec{\mathbf{v}}(t,\vec{r})/Dt$  with the acceleration of a fluid particle found in question iii.

## 5. Yet another example of motion of a deformable continuous medium

Consider the motion defined in a system of Cartesian coordinates with basis vectors  $(\vec{e}_1, \vec{e}_2, \vec{e}_3)$  by the velocity field with components

$$v^{1}(t, \vec{r}) = f_{1}(t, x^{2}), \quad v^{2}(t, \vec{r}) = f_{2}(t, x^{1}), \quad v^{3}(t, \vec{r}) = 0,$$

with  $f_1$ ,  $f_2$  two continuously differentiable functions.

Compute the strain rate tensor  $\mathbf{D}(t, \vec{r})$  for this motion. What is the volume expansion rate? Give the rotation rate tensor  $\mathbf{R}(t, \vec{r})$  and the vorticity vector. Under which condition(s) on the functions  $f_1$ ,  $f_2$  does the motion become irrotational?

#### 6. Isotropy of static pressure

Consider a geometrical point at position  $\vec{r}$  in a fluid at rest. The stress vector across every surface element going through this point is normal:  $\vec{T}(\vec{r}) = -\mathcal{P}(\vec{r})\vec{e}_n$ , with  $\vec{e}_n$  the unit vector orthogonal to the surface element under consideration. Show that the (hydrostatic) pressure  $\mathcal{P}$  is independent of the orientation of  $\vec{e}_n$ .

Hint: Consider the forces on the faces of an infinitesimal trirectangular tetrahedron.
